

gtid

(version 2025-05-10)

USAGE

```
sys gtid  
<task id in D>  
<parent task id in X>
```

DESCRIPTION

This call returns the running task's system id and in addition the running task's parent id. The task id may be used for generating unique filenames.

DIAGNOSTICS

No errors are returned.

(if the parent-id appears to be fancy numbers, most likely your old kernel does not support the <parent task id> feature)
