

Version 3.0

^ Cable box

^ Air vent

^ Air vent / Cable hole

The board is made of 2mm or 1.5mm thick 'Epoxy GRP Sheet' depending on the guide rails used.

When the plates were delivered it turned out that they had not been sawn but cut and therefore had bad edges. Fortunately the width was 103mm and not the ordered 100mm.

So the best long side of the plates was made more even on waterproof sand paper No. 80 and then smoothed with No.100.

Then made the boards 100x160mm on the saw table with a diamond saw blade.

Print the "Layout_A4.pdf" with LaserJet on 'MAT A4 sticker' paper.

Printer setting

Paper Type: Sticker or Thick Paper

Resolution 1200 dpi

Size: Actual

Black & White

Measure the width of the printout, this will usually be slightly smaller than 100mm, but 99.5mm is no problem.

This deviation is incorporated in the oversize holes to be drilled.

It works well to stick two plates together at the corners with 2cm double-sided tape.

Cut out the A4 Layout and stick it securely on the plate.

Now drill all holes with a 1mm CNC drill.

Then drill all the holes with a 2mm HSS drill,

letting the drill center itself in the 1mm hole.

Now drill all holes to the correct size, drill from both sides!

Drilling the 40mm hole can be replaced by milling a square hole.

Now mill or saw the recesses per plate, saw the milled parts into pieces of 5x5mm.

Drill a 3mm hole in each piece and use them as 2mm spacers.
